Annex A2. Taste and Texture results

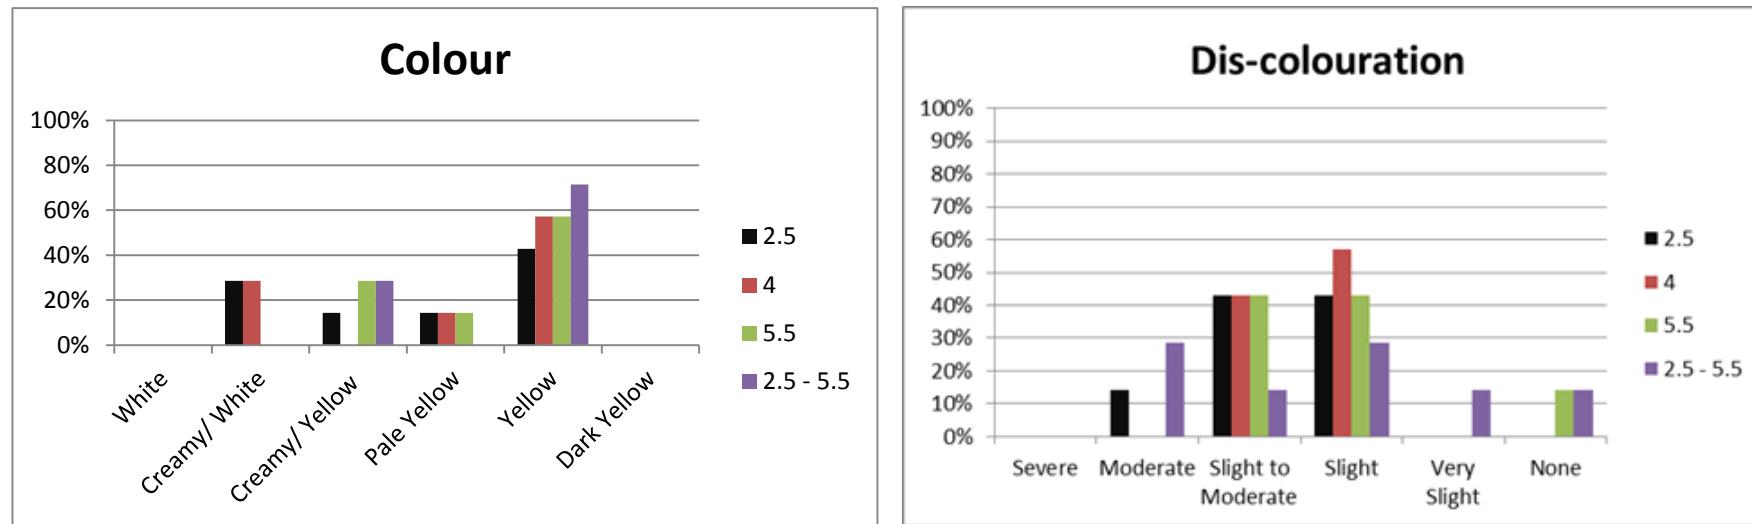

2012-13 Tasting panel – FPSA committee members

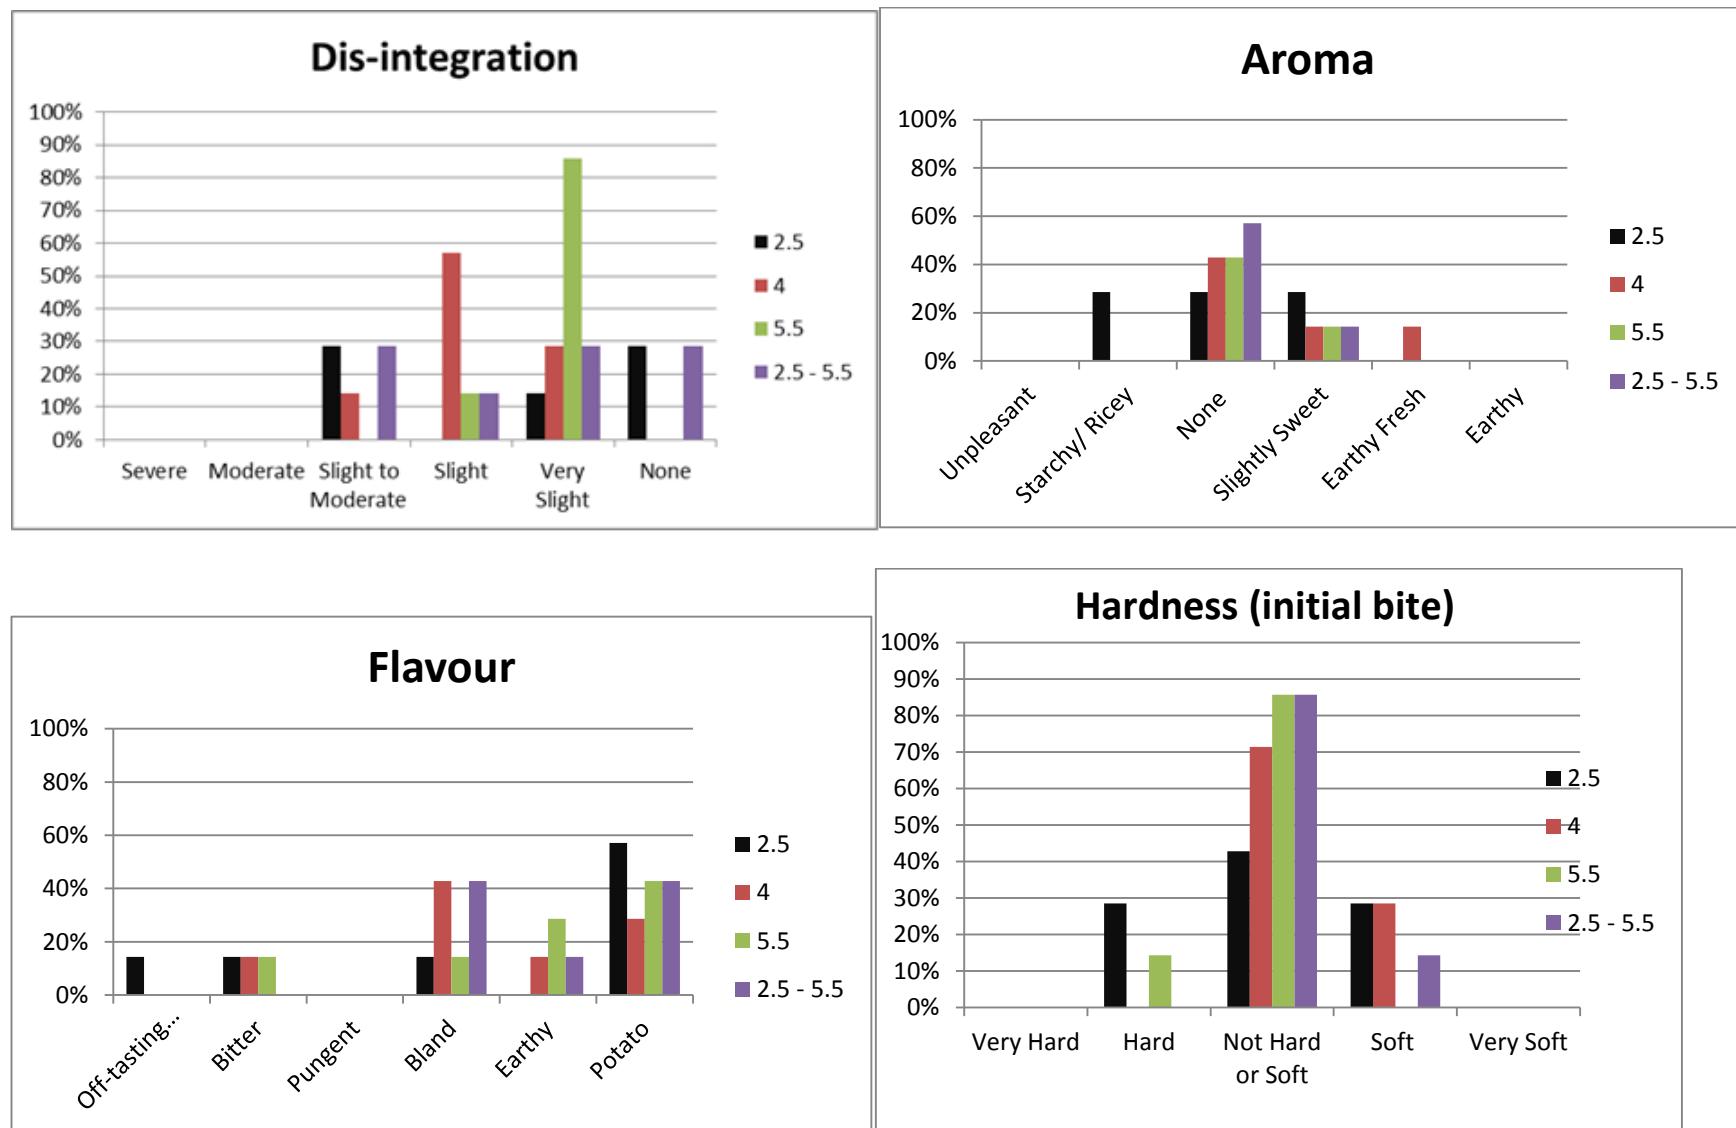

2013-14 Tasting panel – FPSA member representatives with experience of taste and texture assessment

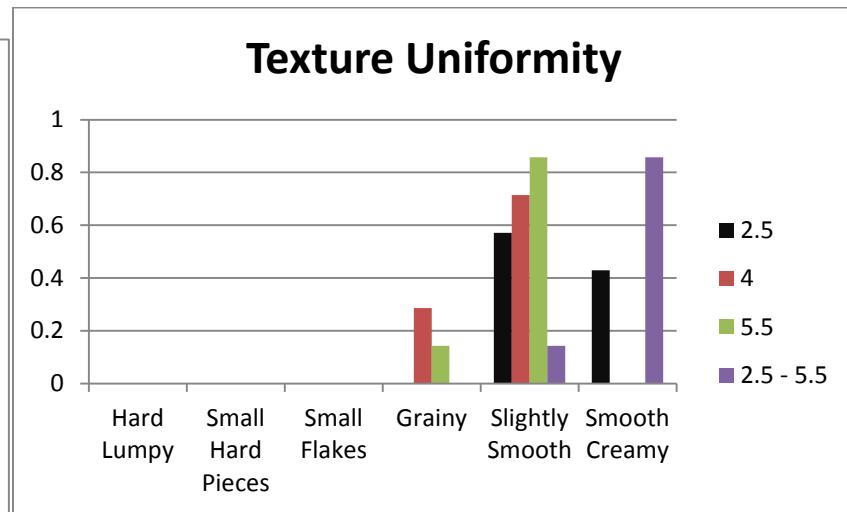

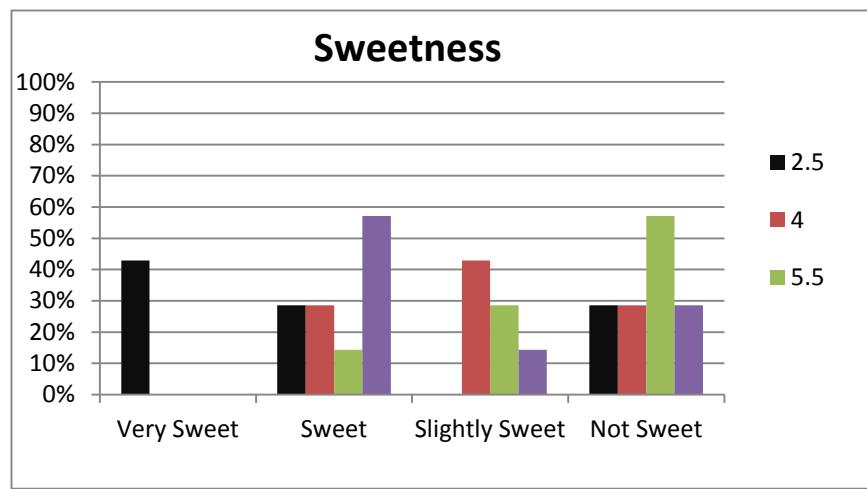

Taste and texture 2012-13

Individual taste or texture attributes are identified in graph title and descriptors in X-axis.

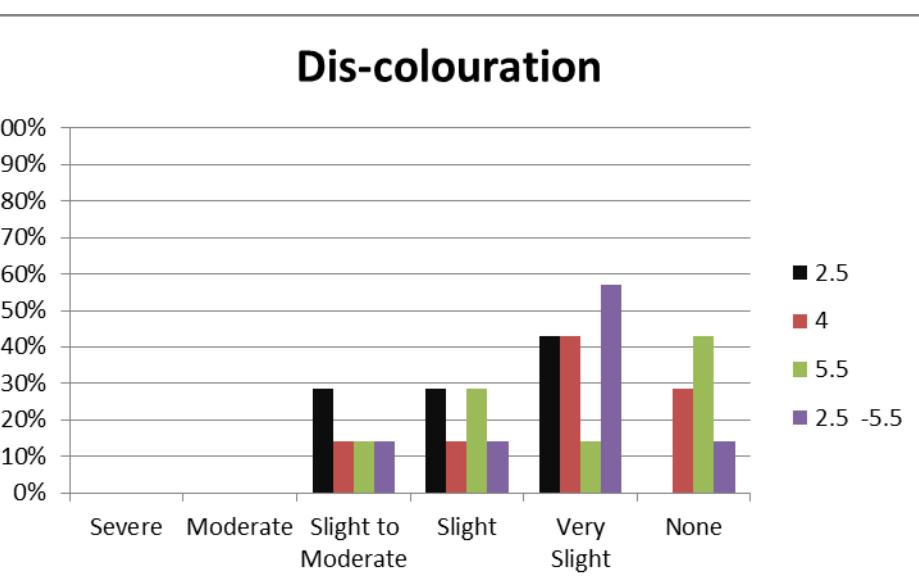

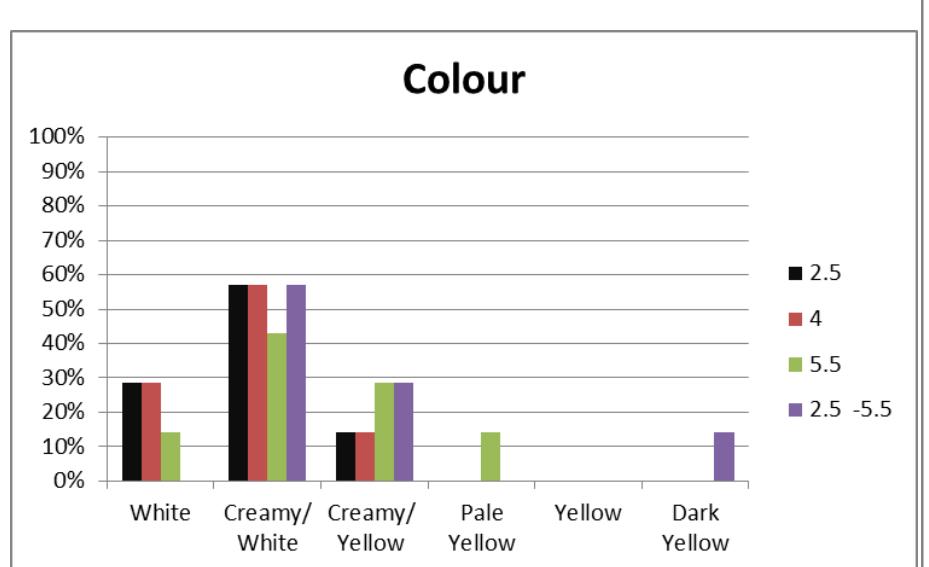

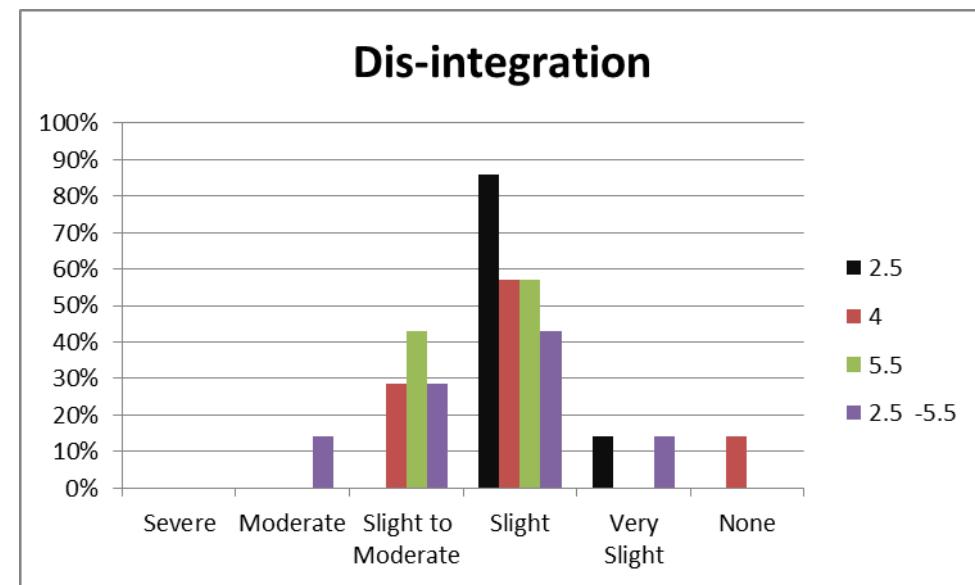

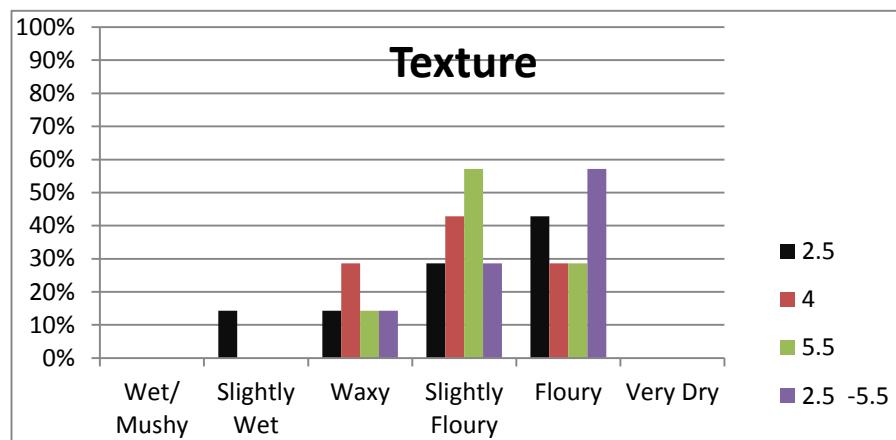

Annex A2.b.1 Taste and texture attributes Desiree 2012/13

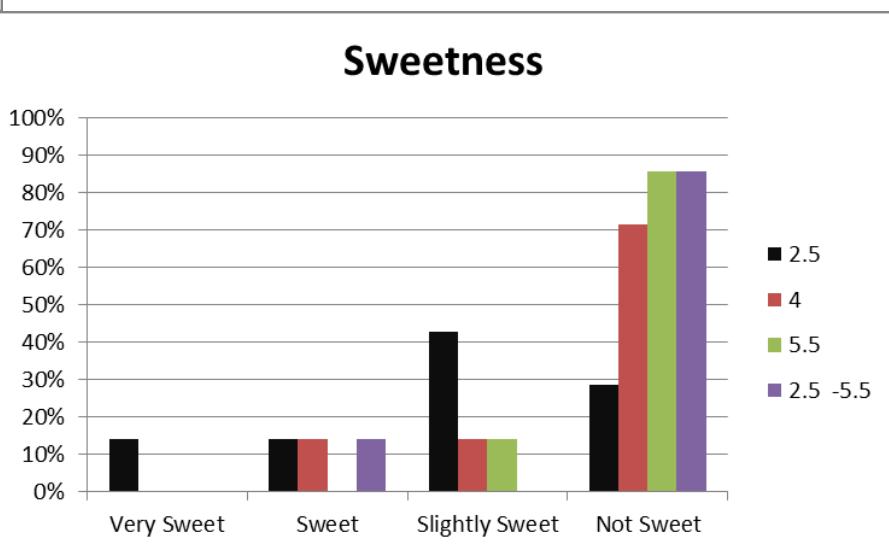

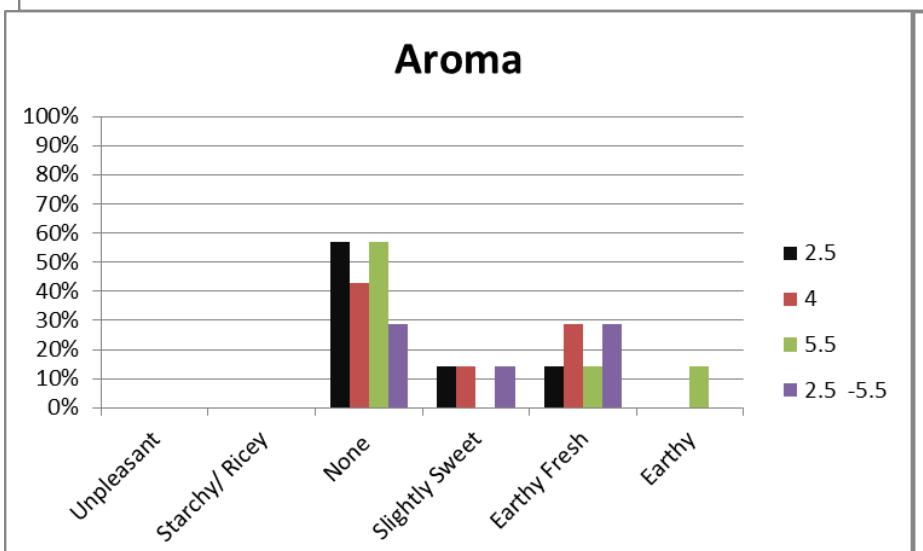

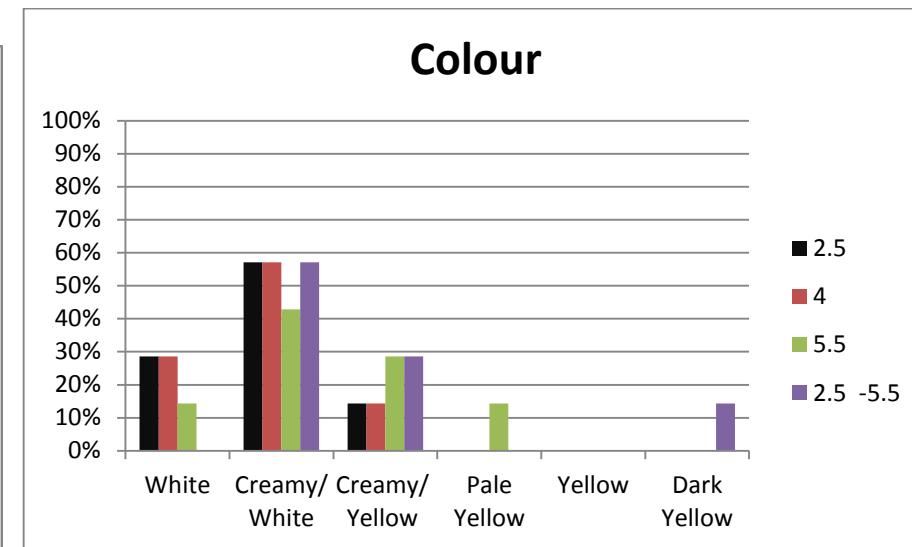

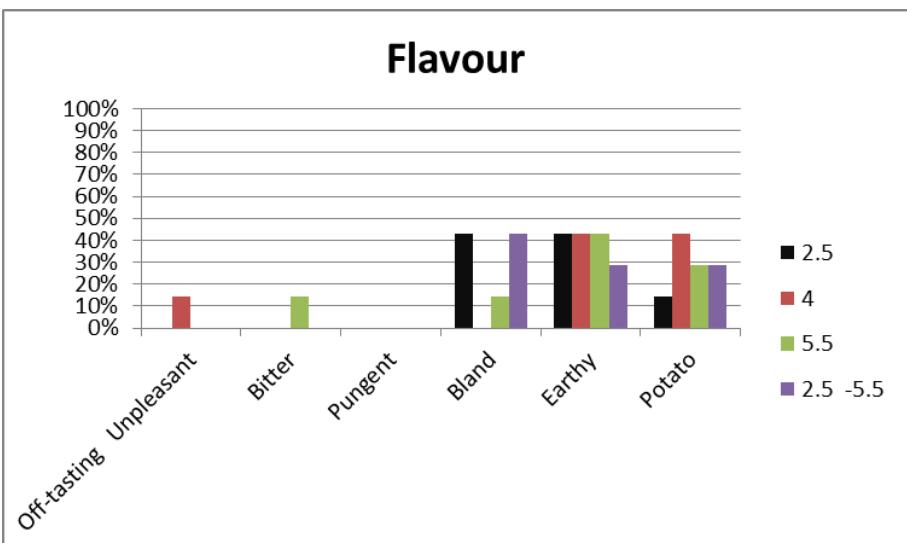

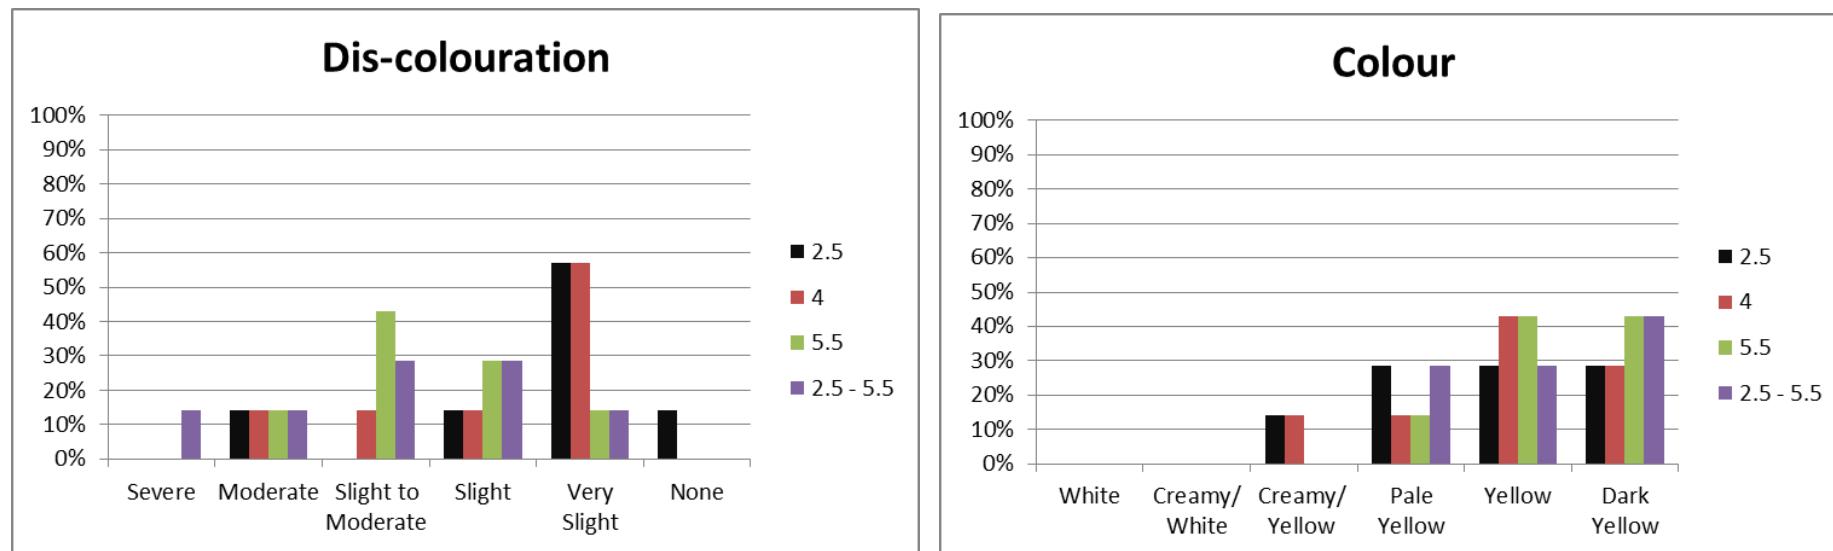

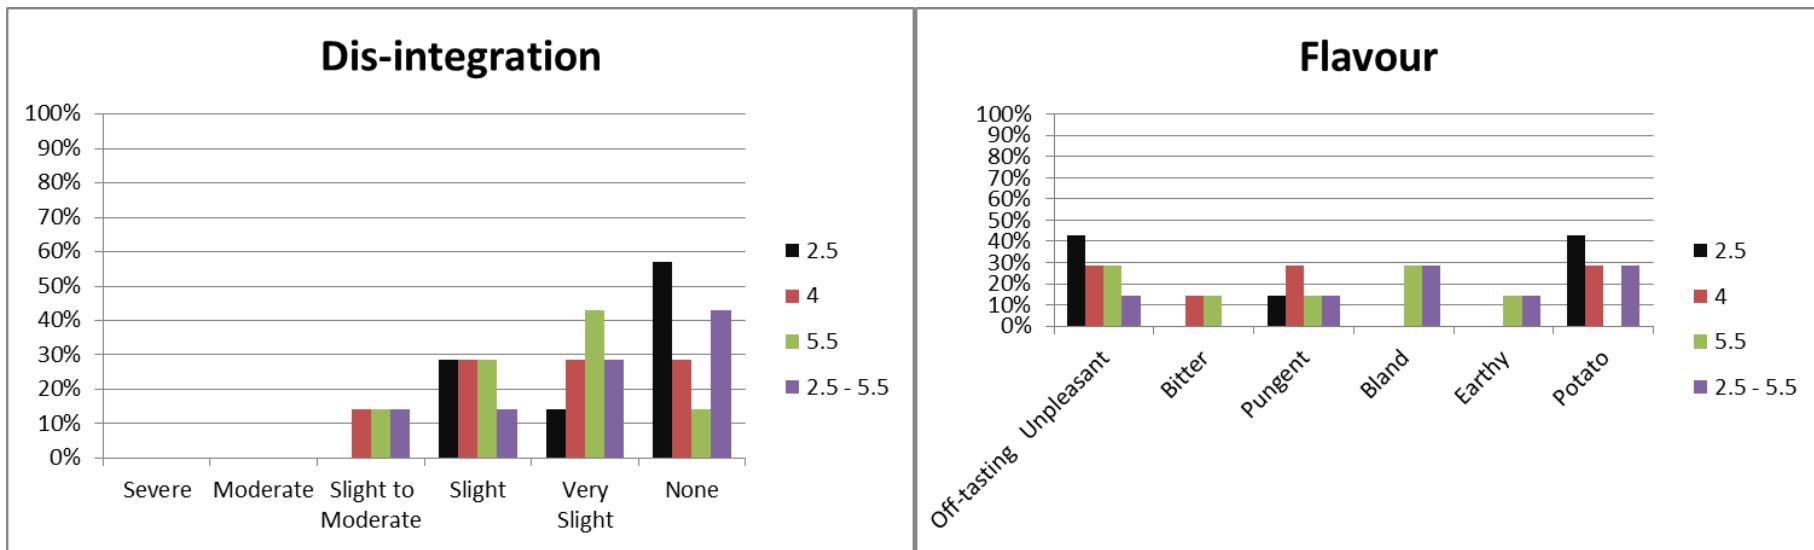

Annex A2.b.1 Taste and texture attributes King Edward 2012/13

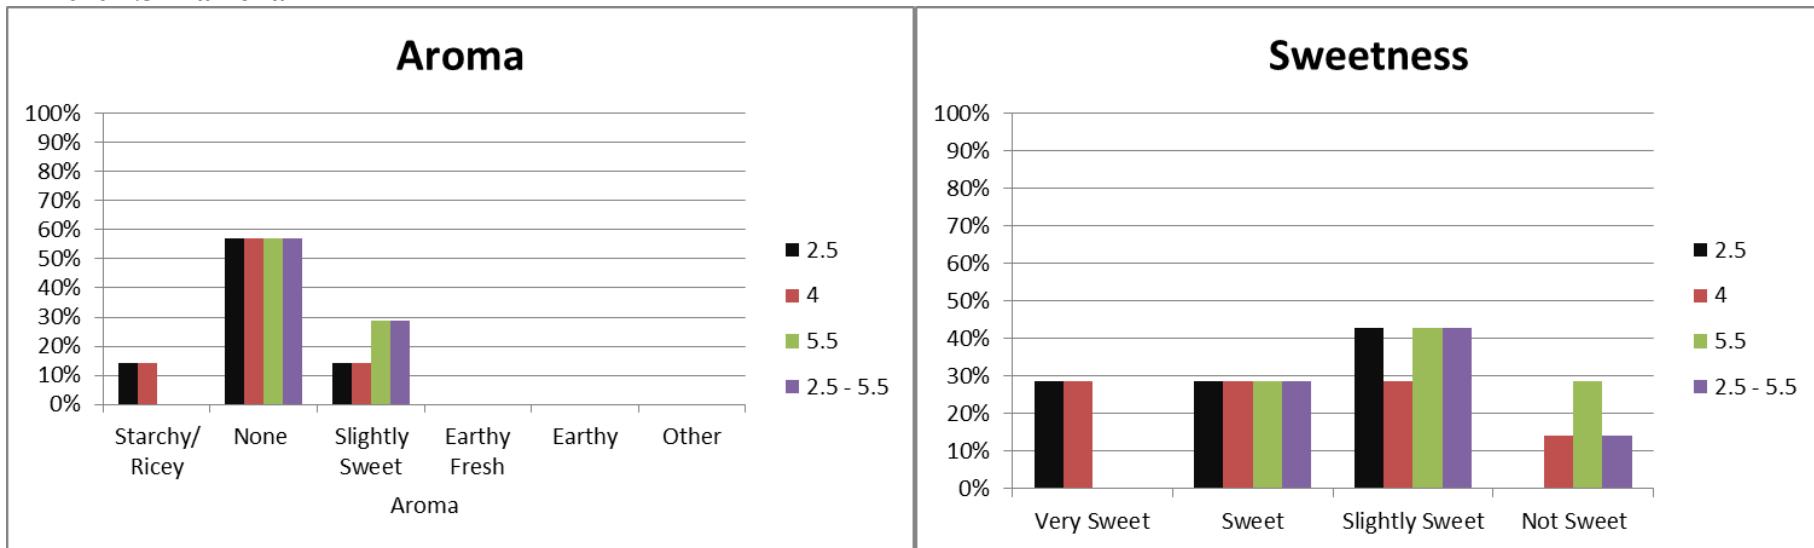

Annex A2.b.1 Taste and texture attributes Marfona 2012/13

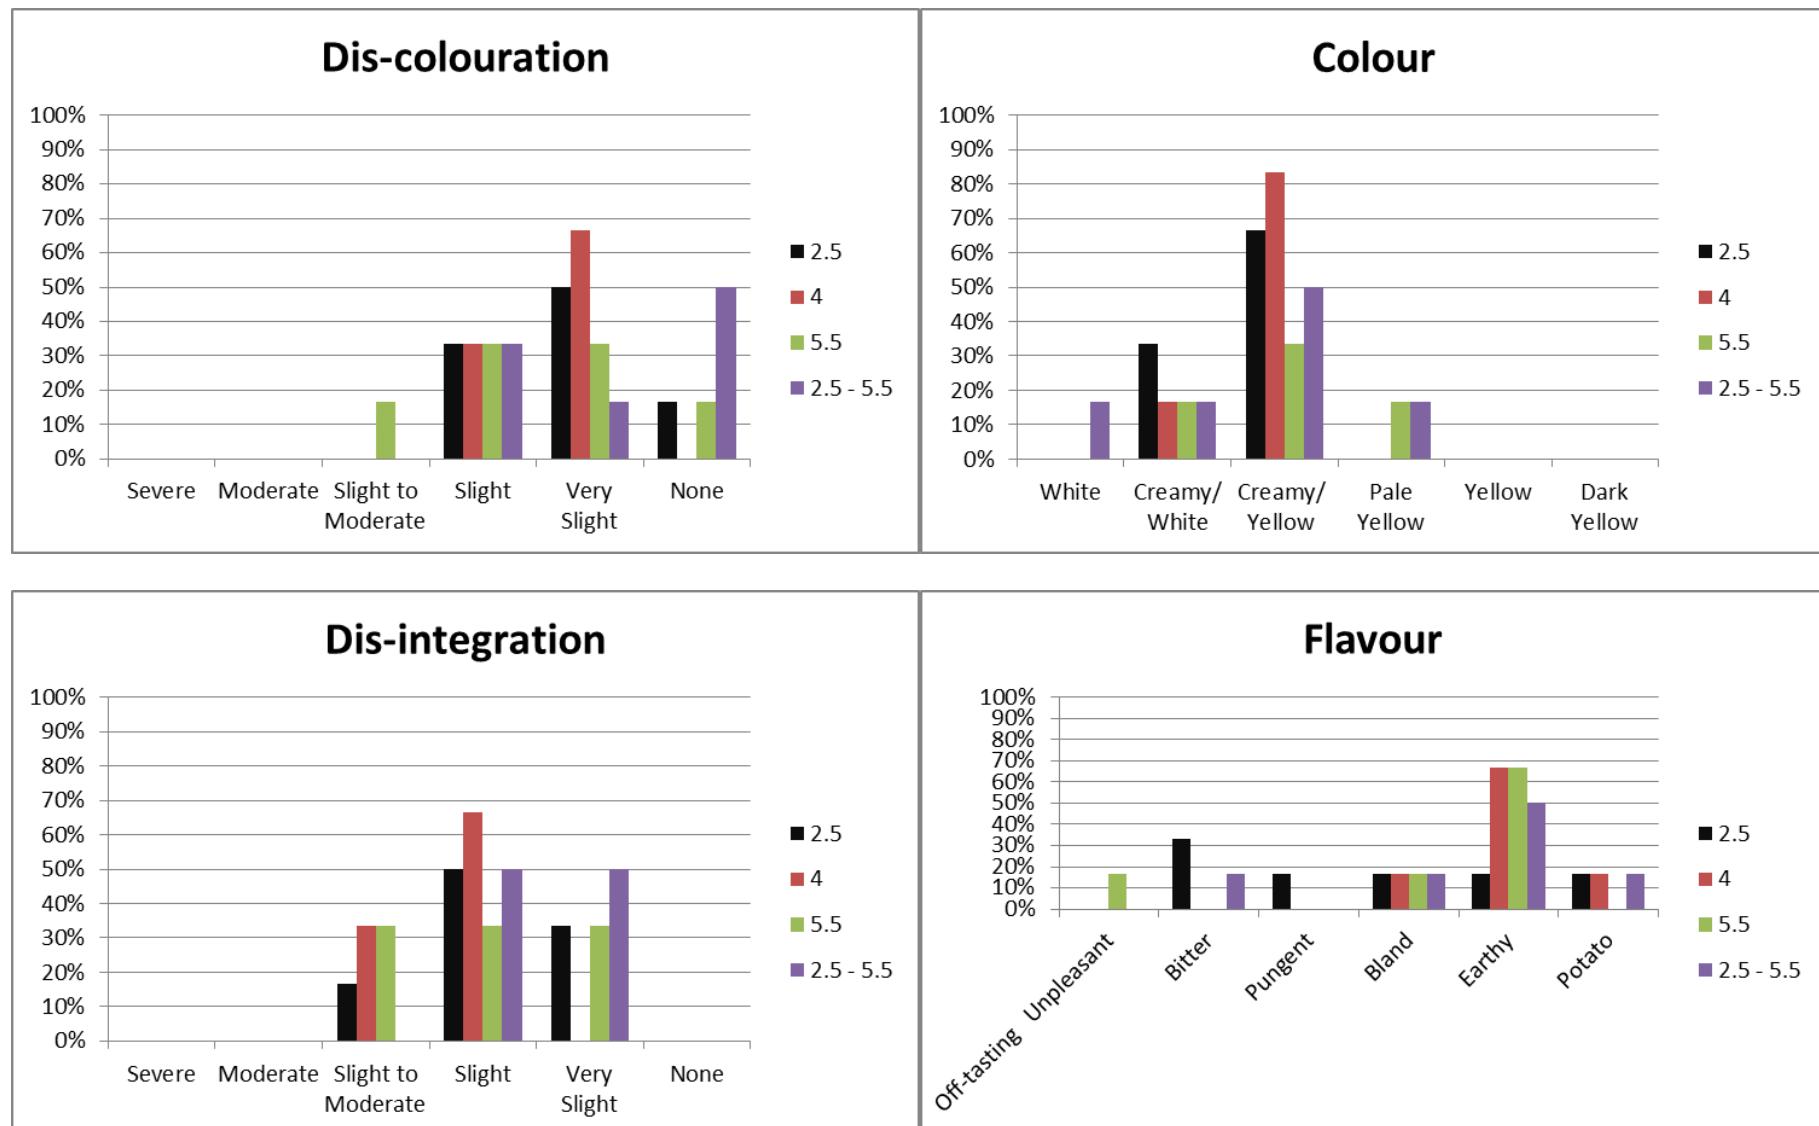

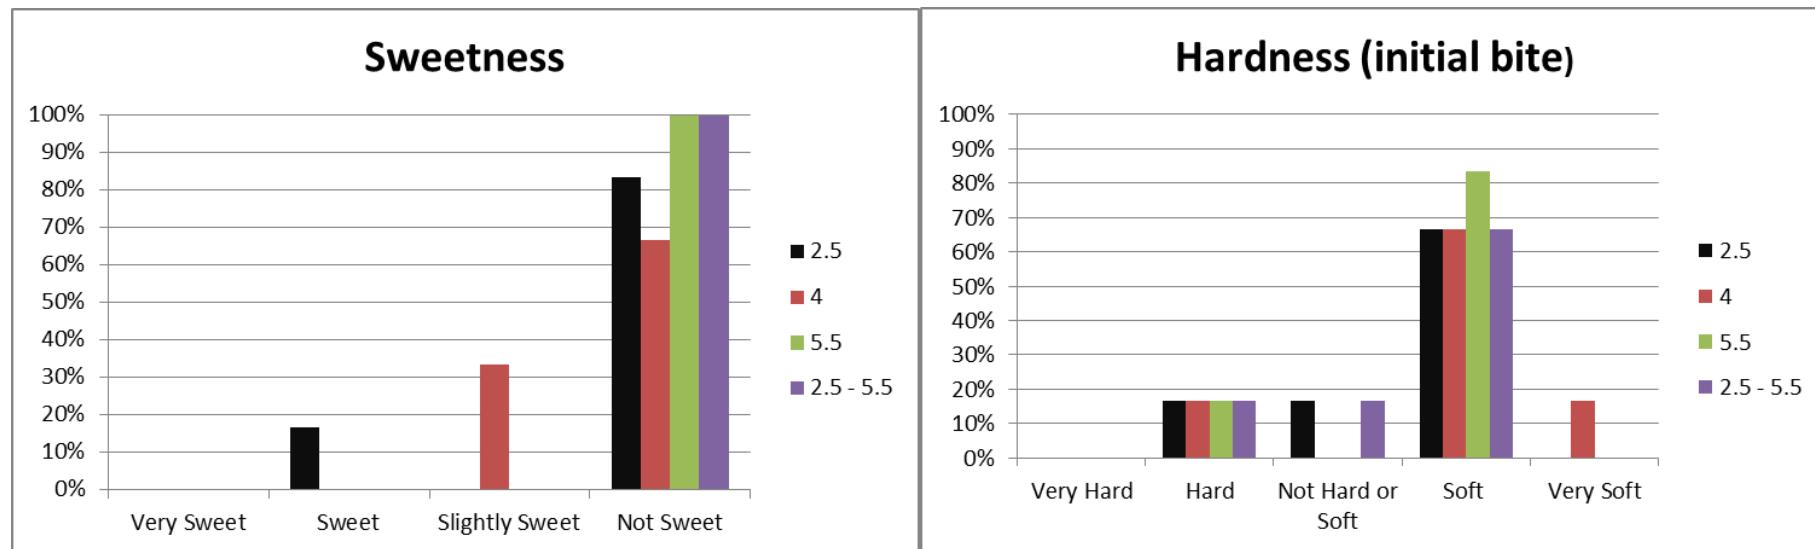

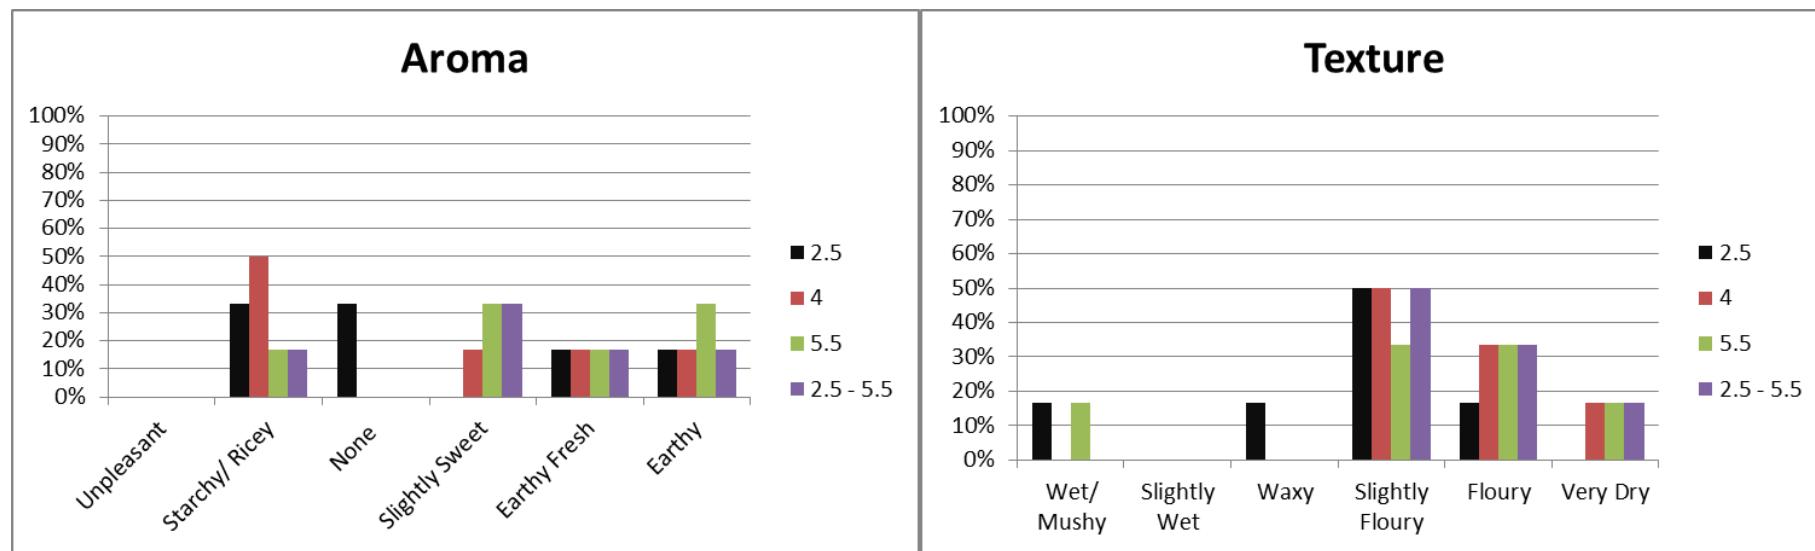

Annexe 1.3 Marfona

Annex A2.b.1 Taste and texture attributes Maris Piper 2012/13

Annex A2.b.2. Taste and texture, Taste Panel Procedure 2012/13

The following guidelines should be followed when rating attributes of a potato sample:

The emphasis is on the specific attributes identified in the evaluation form rather than personal preferences.

Space is provided for additional comments on taste and texture attributes that are not specifically mentioned but warrant further comment.

Please do not talk with other panellists during evaluations.

Please refrain from smoking, eating, or drinking for 45 minutes prior to tasting.

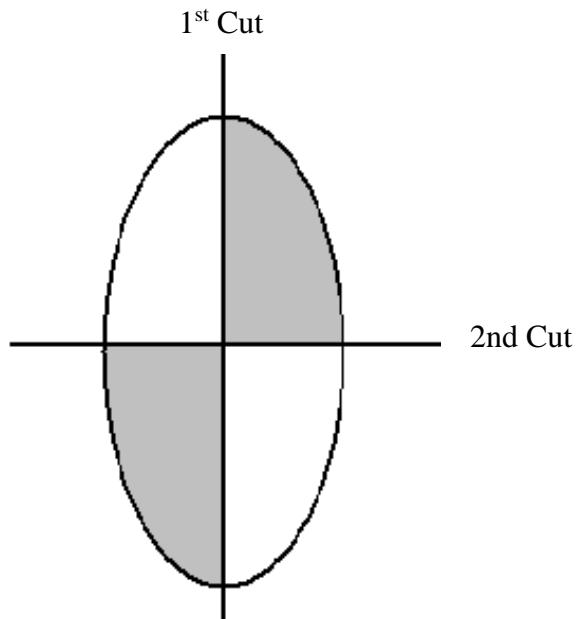

Water is provided to clear the palate between samples, if necessary.

If you have a question regarding the Taste Panel, ask the person conducting the panel.

Annex A2.b.3. Taste and texture, Procedure for the preparation of cooked potatoes Study 2012/13

Procedure for the preparation of cooked potatoes

1. Avoiding damaged, rotting and greens, select 12 tubers from each replicate tray, pool into one new tray.
2. Peel tubers in the rumbler until >95% of peel is removed
3. Cut in half longitudinally, then cut each half transversely, then cut vertically (total 3 cuts)
4. From each tuber select two diagonally opposite eighths for cooking (see diagram below)
5. Peel any remaining skin from surface of quarters with a hand peeler and rinse in fresh water (from SBCSR kitchen only).
6. For each sample cook 20 quarters per sample in steamer (check with skewer until cooked)

Annex A2.b.3. Taste and texture, Procedure for the preparation of cooked potatoes Study 2012/13

Annex A3. Costs of storage, Warmer Storage Modelling

Jon Swain, Farm Energy Centre, Stoneleigh Park, Kenilworth, CV8 2LS

Introduction

Quantification of the effects of warmer storage on energy consumption can be done both experimentally and theoretically. Experimental work in the field can give confusing and unreliable results as control of factors such as harvest date and conditions, market pressures, disease in store etc. can impact on energy use to such an extent that the change in energy consumptions are indeterminable.

Theoretical modelling provides an alternative which gives the user control over the external influences to better determine the energy changes. It is therefore this approach which was agreed as the best way to analyse warmer storage effect on energy consumption.

Materials and Methods

Software

An MS Excel model was constructed as the analysis package. The model analysed the impact of changing conditions, both internally and externally, on an hourly basis for the duration of a set storage season. The model was as close as possible to a real world store and was based on a particular design and construction that is widely used in practice. Previous projects – R401 and R439, supplied information to populate the model's parameters and to verify that the resulting energy consumption predictions were realistic.

Model parameters

The table below describes the information used in the model, whether it is a variable or fixed value and how it was obtained.

Item	Type	Values (where applicable)	Source
Building dimensions	Fixed values	Length Width Height to eves Height to ridge	Real world store
Insulation levels	Fixed values	Thickness on roof Roof U value Thickness on walls Wall U value	Real world store
Air leakage	Fixed value	Permeability	Results of R439
Type of cooling and fan size	Fixed for the building size	Refrigeration and typical fan size	Results of R439
Crop data	Respiration rate – fixed Target store temp – variable Start crop temp – fixed Max cooling/day - fixed	1.75 mgCO ₂ /kg/hr (5.18 W/tonne) 2.5, 4 and 5.5 °C 20 °C 0.5 °C /day	Measured values Project variable Ambient temp Store managers guide
Harvesting times and storage duration	Fixed	September harvest – end June store empty	Project spec
Location	Variable	5 locations	Project spec
External temperatures	Variable	3 year average of hourly values	Based on location

Table 3.1 Input Parameters

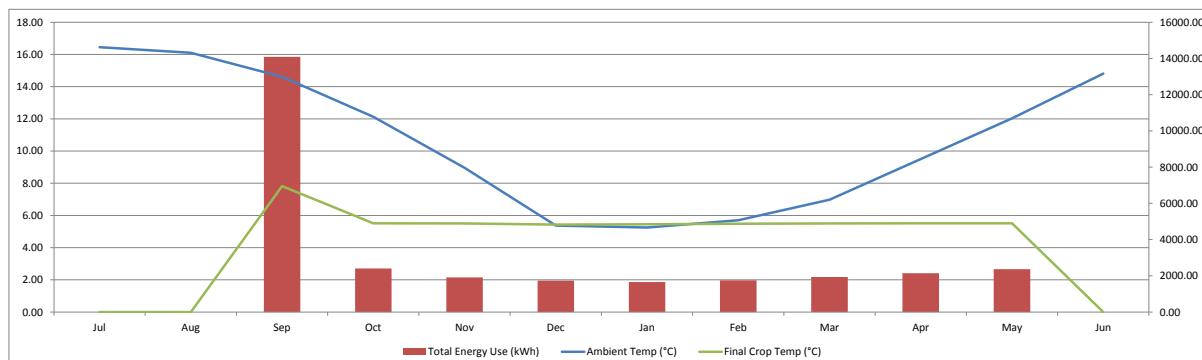

Building Characteristics		Refrigeration Equipment	
Width (m)	26	Compressor Size (kW)	18
Length (m)	26	COP	4
Height To Eaves (m)	10	Fan Size (kW)	12
Height To Ridge (m)	7		
Ambient cooling	No		
Temp diff at which ambient is available	3		
Insulation Levels		Crop Data	
Type	Composite Panel	Respiration Rate (W/tonne)	5.18
Thickness on Roof (mm)	70	Tonnage	1000
Thickness on Walls (mm)	50	Target Temperature (°C)	5.5
		Starting Crop Temperature (°C)	20
		Maximum Cooling (°C per day)	0.5
Air Leakage Rate		Month	
Permeability (m ³ /m ² h)	12	Crop lifted from	September
(Air Changes per Hour ACH-1)	0.235	Crop removed from store by	June
Fan Capacity (m ³ /h)	100000		
Location		Location	
		West Country	
		Crop Season	Average

Figure 3.1 Model screenshot

The model provides a table and graphical representation of the results, as seen in Figure 2 below:

	Average Temp (°C)	Total Use (kWh)	Fan Use (kWh)	Compressor Use (kWh)
Jul	31	16.45	0	0
Aug	31	16.10	0	0
Sep	30	14.61	14088	8640
Oct	31	12.13	2402	69
Nov	30	8.96	1910	230
Dec	31	5.37	1736	634
Jan	31	5.25	1652	581
Feb	28	5.70	1748	662
Mar	31	6.98	1933	536
Apr	30	9.50	2144	337
May	31	12.03	2363	56
Jun	30	14.81	0	0
Total		10.66	29,977	11,745
				18,219

Figure 3.2: Results table and graph

Results

The model was run for each of three different target crop temperatures at every location, the locations were:

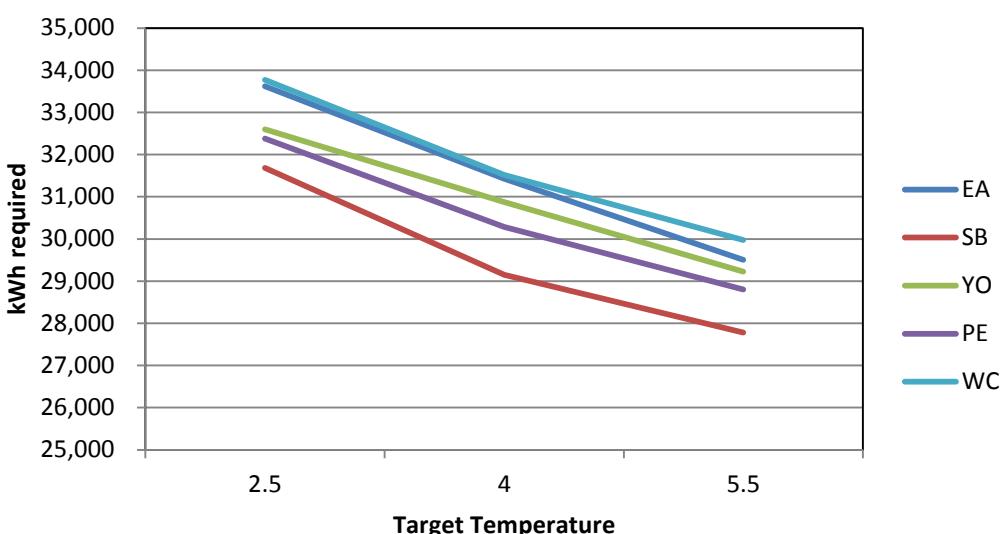

- East Anglia (EA)
- Scottish Borders (SB)
- Yorkshire (YO)
- Pembrokeshire (PE)
- West Country (WC)

The table and graph below show the energy consumption required at each temperature point, all the results are for a 1,000 tonne store.

	EA	SB	YO	PE	WC	Average
2.5	33,621	31,681	32,598	32,380	33,773	32,810
4	31,422	29,147	30,877	30,284	31,517	30,649
5.5	29,505	27,779	29,226	28,805	29,977	29,133

Table 3.2: Energy requirement (kWh) per location at each of the three target temperatures

Figure 3.3 Energy requirement (kWh) per location at each of the three target temperatures

Conclusion and discussion

As is obvious from the results, a greater target temperature causes reduced energy consumption and this has the biggest effect. An increase in target temperature from 2.5°C to 4°C exhibits an

energy saving of 7% on average, and increasing to 5.5°C gives an 11% saving in energy consumption.

The financial saving is an important point to consider because the trade-off between warmer storage and energy savings is increased input, and potentially greater sprouting or break down in store. Figure 4 demonstrates the effect that warmer storage has on the cost of energy required for storing potatoes.

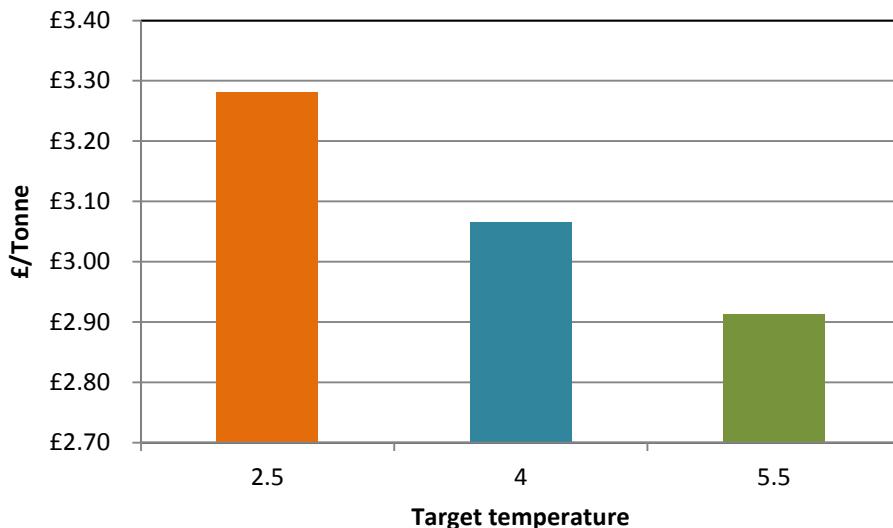

Figure 3.4 Effect of warmer storage on energy costs

The graph demonstrates that a reduction in costs of £0.22 and £0.38 per tonne is achievable from the reduced energy consumption at the two warmer storage temperatures. Reduction in energy consumption also has an effect on the carbon footprint; the carbon emissions associated with the energy consumed will be reduced by 0.96KgCO₂e/tonne¹ and 1.67KgCO₂e/tonne for each of the warmer target temperatures respectively (compared with 2.5°C)

¹ Using 0.44548KgCO₂e/kWh as given by the Carbon Trust 2013 update on carbon emission factors (June 2013)
